

YBT.

YOUR BUSINESS TODAY

Put AI to work in your business.

What we do, the process we follow, and what your
business is left with at the end of it.

Prepared for a business that already works, and wants to run itself.

consulting@yourbusiness.today · yourbusiness.today

Most consultancies leave a report. We leave a business that runs itself.

We are brought in when a business has outgrown the way it has always been run: when the same job is typed into three places, when nobody can say what state a project is really at, and when the few people holding it together can never take a week off.

We start by mapping your data sources: wherever the business creates a record, a document or an asset today. We build the harness that holds that data, equip an AI agent with the skills to run the processes around it, and give you two doors on to it: dashboards for the screen, and an MCP server for the agent. Each piece goes live and starts earning before the next is built.

In one picture

Five steps, and you can stop after any of them.

STEP 1

Map your data sources

Two weeks · fixed price · no commitment to go further

Every business creates its data somewhere: the sheet a quote is worked out in, the document a report is typed into, the message a job is agreed on, the photograph that proves the work was done. We spend two weeks with the people who make them, and we map every source.

You get: a written map of your data sources: what each one creates, who creates it, what it is made from, and where it goes next. With it, the order the harness should take them in and a fixed price for building it. Yours to keep whether or not you take it further.

STEP 2

Build the harness

The first build stage · six to eight weeks · agreed before it starts

The harness is one place that holds what those sources hold. It is almost always a SQL database: a table for each thing your business makes, a column for each fact about it, every value checked at the door so nothing goes in that does not fit. Your people keep working the way they work; the harness is where the result now lives.

You get: your data in one typed, checked store you can see and query, with the first sources retired into it. From this stage on you have dashboards over the harness and an MCP server on it, both live from the first week.

STEP 3

Teach the agent the processes

One process a stage · agreed before it starts · stop after any stage

Around the harness sit the complex processes: the valuation assembled every month, the report written from the week on site, the chase for the invoice that is late. We write each one as a skill that an LLM agent, your own Claude or ChatGPT, runs from start to finish, reading the harness for its inputs and writing its outputs back into it.

You get: one process running itself, with the judgement left to the person who has it and the assembling, typing and chasing done by the agent. Every output lands in the harness, so the next process can start from it.

STEP 4

Two doors on the harness

Included with the harness · grows with every skill

Everything in the harness is reached through two doors.

Dashboards show it the way any software would: a screen for each table, a view for each question people ask of it. The MCP server does exactly what the website does, from inside the agent: the same actions, the same checks, no browser in the middle.

You get: one set of roles deciding who may see and do what, enforced on both doors alike. A person who cannot approve an invoice on the screen cannot approve it through Claude either.

STEP 5

Run it

One monthly fee · cancel on a month's notice

Once a stage is paid for, the harness, the skills and the doors are yours, and so is the written record of how your business works.

Most businesses ask us to stay, because the work never stops changing: a new process to teach, a new table the business now needs.

You get: the thing kept running and kept current, with hosting, monitoring, backups, updates and support inside one monthly figure, a portal your people raise requests in, and a standing day of change work each month.

What it costs

Mapping your data sources is a fixed price. The harness and each skill are agreed before they start. Running it is one monthly fee you can cancel on a month's notice: hosting, the platform it runs on, monitoring, backups, updates and support, all of it inside that one figure and nothing added on top. The written offer carries the figures; there is nothing to negotiate your way into.

What we ask of you

- **Two weeks of access** to the people who create the data, rather than their managers' account of them.
- **One person who can decide.** Not a committee. The work moves at the speed of the slowest approval.
- **Honesty about a bad week.** We are no use to you if we are shown the tidy version.

CASE STUDY

Jewel Bespoke Build

A family-run construction company in Surrey, building loft conversions, extensions and whole-house renovations across the South of England on sixty-five years of trade experience.

The building was never the problem. It was everything around it. The day on site arrived in the office as messages and photographs that somebody then had to turn into a report for the client. Drawings came back marked up. Valuations were assembled by hand. The person who knew where everything was could never be away on a Friday.

We spent a week on paper with the people who do the work, and a week proving the idea in code. Everything arriving at the business is a communication, and a person makes one decision about each one. After that the harness groups them, and the agent writes what has to be written.

Jewel now run on a portal that shows every project at the stage it is really at, a request flow where a plain-English ask becomes a build they can watch, and a connection that lets their own Claude read a job or raise a request without opening the site.

CONNECTOR TOOLS

THE TEAM

The people you meet are the people who do the work.

Nigel Reilly

Managing Partner

Nigel sets the direction of the practice. A career spent across several industries has given him both the commercial judgement and the connections the firm runs on.

Jeremy Ferendinos

Founding Partner

Jeremy looks after the financial and commercial side. He can read a business on paper as well as he can read it on the floor. He brings client relationships of his own.

James Beadle

Founding Partner

James builds the systems. He has done it for large multinational clients and for small and medium businesses. Those are two very different jobs and he is fluent in both.

Tell us what your business is struggling with.

No pitch deck and no discovery fee. A conversation about what is not working, and an honest answer about whether we are the people to fix it.
